Elektrifikatsiya Ukrayiny za roky Radians'koy vlady (Electrification of the Ukraine During the Years of the Soviet Regime) Kiyev, Derzh. vyd-vo tekhn. lit-ry URSR, 1958. 150 p. 3,000 copies printed.

Resp. Ed.: I.T. Shvetsya, Academician, UkrSSR Academy of Sciences; Ed.: M. Pysarenko; Tech. Ed.: Z. Vortman.

**PURPOSE:** The book is intended for the general reader.

**COVERAGE:** The authors discuss electrification of the national economy of the Ukraine during the prerevolutionary period and during the Soviet Five-Year Plans. Achievements of the Soviet regime are noted. No personalities are mentioned. There are no references.

**TABLE OF CONTENTS:**

Card 1/3

Electrification of the Ukraine During (Cont.)	SOV/1865	
Introduction		5
Development of Electrification Before 1941		19
General information		19
Fuel resources		20
Hydroelectric power resources		25
Development of Electric Power in the Ukrainian SSR During the Prewar Period		29
Power in the prerevolutionary period		29
Lenin plan GOELRO and electrification of the UkrSSR		31
Power during the reconstruction period (1921-1928)		37
Power during the First Five-Year Plan (1928-1932)		40
Power during the Second Five-Year Plan (1933-1937)		43
Power during the Third Five-Year Plan (1938-1941)		44
Development of Electrification From 1941 to 1957		49
Power in the Ukrainian SSR During the War and the Postwar Period		51
Power in the Republic during the Great Patriotic War (1941-1945)		51

TITLE: Some conversions of systems containing the imidazole ring. Part 5: Properties of naphth[1,2-d]imidazole and imidazo[4,5-f] quinoline

SOURCE: Khimiya geterotsiklicheskih soyedineniy, no. 4, 1966, 611-613

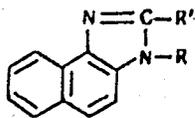

TOPIC TAGS: imidazoquinoline, naphthimidazole, heterocyclic <sup>base</sup> compound, organic nitrogen compound

ABSTRACT: It was shown earlier that imidazole systems can be directly aminated at the CH group of the imidazole ring, the process being dependent on the nature of the nucleus joined to this ring. In order to study this conversion further, some new derivatives of naphth[1,2-d]imidazole and imidazo[4,5-f] quinoline and their reactions with sodium amide were studied. 3-Benzyl-naphth[1,2-d]imidazole (Ia), obtained by benzylating naphth[1,2-d]imidazole, readily reacts with sodium amide in dimethylaniline at 110°, forming 2-amino derivatives (Ic). On the contrary, 3-benzylimidazo[4,5-f]quinoline (IIa) cannot be directly aminated under these conditions; nor does 3-methylimidazo[4,5]quinoline (IIb) form a 2-amino derivative when acted upon by sodium amide, although a similarly structured compound of the naphthimidazole series, (Ib), readily undergoes such a conversion.

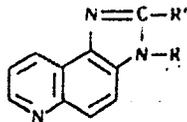

Card 1/2

UDC: 547.785.5+547.831.6+542.958.3

ACC NR: AP6033307

- Ia R=CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; R'=H;  
 b R=CH<sub>3</sub>; R'=H;  
 c R=CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; R'=NH<sub>2</sub>;

- IIa R=CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; R'=H;  
 b R=CH<sub>3</sub>; R'=H;  
 c R=CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; R'=NH<sub>2</sub>;  
 d R=CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>; R'=Cl.

Thus, in contrast to the naphthalene ring, the quinoline ring deactivates the 2-position of the imidazole ring joined to it with respect to sodium amide. 2-Amino-3-benzylimidazo[4,5-f]quinoline (IIc) can be synthesized only by the action of ammonia in the presence of copper salts on 2-chloro-3-benzylimidazo[4,5-f]quinoline (IIId), formed by the action of phosphoryl chloride on 3-benzylimidazolono[4,5]quinoline. When sodium amide acts on 3-substituted derivatives of imidazo[4,5]quinoline, the quinoline ring is not aminated either; this is attributed to the influence of the imidazole ring. The melting points are (°C): (Ia) 170°; (Ic) 256°; (IIb) 189-190°; (IIId) 170-171°.

ABSTRACT: The 13th All-Union Scientific Technical Session on stationary and traction gas-turbines was held in Moscow on the 25th and 26th November 1959. It was convened by the Gas-Turbine Commission of the Academy of Sciences of the USSR, together with the State Scientific Technical Commission of the Council of Ministers of the USSR. The session was attended by 400 representatives of Research Institutes, Turbine and Locomotive Works, Design Institutes, Technical Colleges, Councils of National Economy and other institutes. The following reports were read: "Some Results Achieved in the Development of Small Gas-Turbines" by A.Ya. Gagarin of the Ekonomyser Factory.

AUTHORS: Shvets, I. T., and Khristich, V. A.

TITLE: Experimental investigation of the atomizing device in gas-turbine combustion chambers of the evaporative type

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 4, 1961, 18-19, abstract 41155. ("Izv. Kiyevsk. politekhn. in-ta", 1960, vol. 30, 98-109)

TEXT: The investigation of fuel evaporation by injecting it into a pipe heated by a flame showed that a high degree of vaporization is ensured if the fuel is injected onto the surface of a pipe whose temperature does not exceed 500°C. In this case the atomization quality practically does not depend on the injection pressure, varying in the range of 2 - 30 kg/cm<sup>2</sup>. The degree of vaporization increases with the growing pipe length and the coefficient of air surplus and decreases with the growing air pressure. At low air temperatures the degree of vaporization improves with the growth of the volatility of the fuel. The authors present an empirical formula for the calculation of the pipe length depending on the degree of vaporization, temperature and coefficient of air surplus.

AUTHOR: Khristich, V.A.

TITLE: On pulsation phenomena in the burning of natural gas in gas turbine combustion chambers

CITED SOURCE: Tr. 1-y Vses. nauchno-tekhn. konferentsii po probl. vibratsion. i pul'satsion. goreniya. M., 1962, 51-59

TOPIC TAGS: pulsation, pulsation phenomena, natural gas, gas combustion, gas turbine

TRANSLATION: The author describes the procedure and results of an experimental study of pulsation combustion in the combustion chamber of a gas turbine operating on natural gas: He studied the effects of the following factors on the characteristics of pulsation combustion: 1) the type of burner device; 2) temperature and air excess factor; 3) type of pilot light; 4) air distribution in the chamber. It was found that the use of register burners with preliminary

Card 1/2

ACCESSION NR: AR4015129

fuel atomization. It is shown that there are two ranges of pressure pulsation: the very low frequency range (below 5 cycles/sec) and the higher-frequency range (30-40 cycles/sec).

It has been shown that the appearance of pulsation combustion is accompanied by changes in some of the characteristics of the working process in the chamber. It is shown that pulsation combustion involves the intensification of mixing processes and an increase in the degree of combustion. It has been shown experimentally the possible means of controlling pulsation combustion are as follows: the installation of pilot lights with regulated flame size; regulation of air distribution in the chamber; any other methods affecting the size and structure of the pilot light. Bibliography with 21 titles. Yu.F. Dityakin.

AUTHOR: Khristich, V. A. (Candidate of technical sciences); Bashkatov, Yu. N. (Engineer); Chernin, Ye. N. (Engineer); Shevchenko, A. M. (Engineer)

TITLE: Effect of a burner on the characteristics of a gas-turbine combustor

SOURCE: Energomashinostroyeniye, no. 9, 1964, 12-15

TOPIC TAGS: combustor, combustor test, combustion chamber, combustion chamber test, gas turbine/GT-25-700-1-LMZ gas turbine plant

ABSTRACT: A continuation of the authors' earlier experiments (Energomashinostroyeniye, 1962, no. 10) is reported. The possibility of a radical improvement in a premixing register burner by modifying its design was explored. The principal experiments were conducted at an air pressure of 1.5 atm, a temperature before the chamber of 300C, an air flow of 7-8 m<sup>3</sup>/sec, and an air-fuel ratio of 4.5-20 (primary-air ratio, 1.1-5). Several types of

Card 1/3

ACCESSION NR: AP4045906

burners were tested; four of them are shown in Enclosure 1. The flow aerodynamics was investigated with a cold blowdown of the chamber. Register burner I was found to produce the highest temperature field in the flame tube. The best operating conditions of the flame tube were observed (at 700C of exhaust gases) with nonregister-type diffusion burners. The intensity and completeness of combustion were also investigated (curves supplied), as well as combustion stability, pressure loss in the chamber, and the temperature field of exhaust gases. Orig. art. has: 6 figures and 2 tables.

TITLE: Some relationships for a gaseous diffusion flame burning in the turbulent wake behind a flame holder

SOURCE: AN UkrSSR, Institut tekhnicheskoy teplofiziki, Teplofizika i teplotekhnika (Thermophysics and heat engineering), Kiev, Naukova dumka, 1964, 202-206

TOPIC TAGS: diffusion flame, air breathing propulsion, flame holder, combustion

ABSTRACT: It has been previously found that diffusional burning behind a flame holder gives very high mixing rates, short flame lengths, and higher combustion efficiencies as compared with conventional diffusion flames. Since the flame length is a function of air velocity, high and variable air excess coefficients can be used, which makes the process suitable for use in turbine combustion chambers and in other processes. The design of such a process presents difficulties because of the lack of experimental data. The process has there-

fore been studied by obtaining velocity and concentration profiles and by flame photography to determine the effect of the following parameters on the flame length: gas discharge velocity (10—210 m/sec), air velocity (10—50 m/sec), diameter of the gas nozzle (1—5 mm), width of the flame holder (20—40 mm), opening angle of the flame holder (30—180°), angle of attack of the airstream (0—24°), and position of the gas jet in the vertical plane (0—180°). The flame length increased with increasing gas velocity, increasing gas nozzle diameter, and increasing flame holder width, and it decreased with increasing air velocity, opening angle of the flame holder, and angle of attack of the airstream. Since the gas jet was deflected by the recirculation zone in the direction of the flame holder apex, i.e., countercurrently to the airstream, the trajectories of the gas jet could be calculated by a method for jets in transverse flow developed by Yu. V. Ivanov. The experimental data were correlated by an empirical equation for the relative length of the flame as a function of the gas and air densities and velocities, the width of the flame holder, and the gas nozzle diameter. It is recommended that more data be obtained over a wider range of operating and geometry parameters to make the relationship more accurate. Orig. art. has: 3 figures. [pv]

TITLE: The nature of oscillatory combustion in high-performance combustion chambers operated with gaseous fuel

SOURCE: AN UkrSSR. Institut tekhnicheskoy teplofiziki. Teplofizika i teplotekhnika (Thermophysics and heat engineering). Kiev, Naukova dumka, 1964, 215-222

TOPIC TAGS: combustion, combustion chamber, air breathing propulsion, combustion instability, oscillatory combustion

ABSTRACT: Combustion instability was studied in a test combustion chamber 209 mm in diameter and 6 m long equipped with pressure and oscillation gages. Some of the results were verified on the full-size GT-25-700 turbine combustion chamber. In the experiments, the locations of the instability regions in the chamber and the oscillation frequencies and amplitudes were determined with 5 different burners as a function of the air excess coefficient and air flow velocity (up to 40 m/sec). The calculated natural frequencies and the amplitudes were in good agreement with experimental values. The width of Card 1/2

L 25031-65

ACCESSION NR: AT5004226

the instability regions was a function of air velocity and the air excess coefficient; it decreased with an increasing air excess coefficient. The number and size of the instability regions was found to be dependent on the type of burner. Two burners had substantially different behavior with respect to instability although their geometry was similar. It is concluded that the flame structure is the most important factor in instability. Stability improves when long, thin flames are used. A short, wide flame decreases stability. The flame structure can also be changed by varying the primary-to-secondary air ratio. TOPIC TAGS: gas turbine, combustion chamber, flame tube, flame  
stabilizer, combustion intensification

ABSTRACT: This Author Certificate was issued for an annular combustion chamber with a flame tube inside which a fuel collector and a stabilizing device are mounted. In order to intensify the combustion process and reduce the flame tube length, the stabilizing device is made of a system of alternating radial angles inclined to each other and fixed alternately on the inside and outside shells of the flame tube. In a second variant, to achieve uniform fuel supply, the fuel collector is made of two concentric rings on the inner and outer shells of the flame tube with fuel feed ports provided behind the stabilizer angles.

TITLE: Thermoelectric method for <sup>1,55</sup>measuring gas flow velocity fluctuation

SOURCE: Inzhenerno-fizichesky zhurnal, v. 9, no. 4, 1965, 501-506 <sup>9M</sup>

TOPIC TAGS: gas flow, flow velocity, velocity measuring instrument, flow measurement, turbulent flow, thermoelectric sensor

ABSTRACT: The theoretical and experimental investigation of combustion and heat exchange processes in fluctuating and turbulent flows indicate that the velocity fluctuations determine decisively the intensity of the processes. However, the existing methods for velocity fluctuation measurements are either incompletely developed or inapplicable to high temperature flows. Consequently, working at the Institute of Engineering Heat Physics of the AN UkrSSR <sup>55</sup> (Institut tekhnicheskoy teplofiziki AN UkrSSR) in cooperation with the Kiev Polytechnic Institute (Kiyevskiy politekhnichesky institut), the authors developed a thermoelectric method permitting determinations within very hot gaseous currents. Experiments with the device, shown in Fig. 1, confirm its reliability and simplicity, and the data obtained are in fair agreement with those obtained using different methods of flow velocity fluctuation determination.

ENGINE COMPONENT, ENGINE COOLING SYSTEM, COMBUSTION CHAMBER WALL TEMPERATURE

ABSTRACT: The tube is a plane perforated cylinder, simple in shape and to manufacture. Air from the circular channel of the chamber enters the inner hollow of the flame tube through the holes, creating a dense low temperature layer along its walls, thus decreasing the convective heating of the walls, and facilitating removal of some amount of heat produced by radiation. The tube tendency to wrapping is diminished, the life of the chamber is increased, and the amount of heat-resisting steel used is reduced. The tube is promising for use in combustion chambers working on gas fuel.

TITLE: Several characteristics of heat transfer in a gas turbine combustion chamber operating on gaseous fuel

SOURCE: Ref. zh. Mekhanika, Abs. 5B314

REF SOURCE: Vestn. Kiyevsk. politekn. in-ta. Ser. teploenerg., no. 2, 1965, 26-33

TOPIC TAGS: gas turbine engine, combustion chamber, combustion research, flame tube, thermocouple

ABSTRACT: Experiments were performed on a common single-register combustion chamber of the straight-flow type. The flame-tube is welded as a single unit. Three rings of 4-mm diameter openings for cooling air are located on its shoulders, and the flame-tube wall cooling is compound. The fuel unit is of the diffusion type. Air is introduced into the combustion region through the register and a perforated cup. To determine the metal and air temperatures, 39 and 8 chromel-aluminum thermocouples, respectively, are used. To measure the flame temperature, movable, water-cooled platinum-rhodium thermocouples were placed at three sections along the length of the flame tube. Compound probes were located at the entrance and exit of the combustion chamber to measure the temperature and velocity of the air and gases. The experiments

Card 1/2

ACC NR: AR6028073

were performed at 1.08--1.37 bar. It was established that during natural gas combustion the heat flow to the walls of the flame tube can exceed  $100 \cdot 10^3 \text{ wt/m}^2$  despite the weak radiance of the flame. The convection component represents about 30--40% of the total heat flow in the type of combustion chamber investigated. The total heat flow and its components are not uniformly distributed along the length of the flame tube. The character of the heat flow distributions is strongly dependent on the initial temperature, structure of the flame, and on the operating parameters of the combustion chamber. The cooling of the flame tube walls is accomplished basically by convection. It is important to develop new rational flame tube designs, which will lower the convective part of the heat flow and increase the radiative heat extraction. Bibliography of 4 titles. A. TITLE: The problem of the equation of motion of pendulum seismographs

PERIODICAL: Akademiya nauk SSSR. Seriya geofizicheskaya. Izvestiya, no. 3, 1961, 443-444

TEXT: The purpose of the present paper is to obtain a more exact differential equation of motion of a seismograph. When a time dependent constraint is applied to a material point, its motion has two components; translational (together with the constraint) and relative (along the constraint). The equation of motion is given (Eq. 1).  $\bar{v}_a = \bar{v}_e + \bar{v}_r$  (1)

Neglecting its rotational motion, this equation can be differentiated with respect to time t to give the accelerations  $\bar{w}_a = \bar{w}_e + \bar{w}_r$  (2)

Assuming the resistance of the medium to be directly proportional to the

Card 1/3

24220

S/049/61/000/003/005/005  
D249/D301

The problem of the equation...

velocity, the author finds from Newton's second law that

$$m\ddot{\bar{w}}_r = \bar{F} + (-m\ddot{\bar{w}}_e) + (-\beta\dot{\bar{w}}_r) + (-\beta\dot{\bar{w}}_e) \quad (3)$$

where  $\beta$  is the resistance coefficient. In the seismograph theory the force  $\beta\dot{\bar{w}}_e$  is usually

neglected although it affects both the amplitude and phase of the pendulum oscillations. The differential equation of motion of a system (or a point) with time-dependent constraints, which allows for the resistance of the medium can be deduced using Lagrange's equations of the second type. For a system with time-dependent constraints the equation for kinetic energy is given and the dissipative function is generalized. The author, after a series of differentiations, gives equation of motion of the pendulum (Eq. 8)

$$\ddot{\varphi} + \frac{\beta}{m} \dot{\varphi} + \frac{g}{l} \sin \varphi = -\frac{\ddot{X}}{l} \cos \varphi + \frac{\dot{Y}}{l} \sin \varphi - \frac{\beta \dot{X}}{lm} \cos \varphi + \frac{\beta \dot{Y}}{lm} \sin \varphi. \quad (8)$$

Using  $\beta/m = 2\epsilon_1$ ,  $g/l = n_1$  and assuming that the oscillations are small (i.e.  $\cos \varphi = 1$ ,  $\sin \varphi = \varphi$ ), Eq.(8) may be written as

(For Eq. (9) see next card)

TITLE: Concerning one method of solving problems of thermal conductivity of two- and three-layer systems

SOURCE: 21 Teplofizika vysokikh temperatur, v. 3, no. 2, 1965, 272-275

TOPIC TAGS: thermal conductivity, layered system, boundary condition

ABSTRACT: By transforming the equations for the heat exchange between the individual layers of a two- and three-layer sandwich structure into boundary conditions applying to the individual layers, the author succeeds in splitting the coupled thermal-conductivity equations for the entire system into individual equations applicable to each layer individually. A step by step procedure is developed for the case of a three-layer system. It is shown that whereas for a

Card 1/2

L-62185-65

ACCESSION NR: AP5010468

two-layer system the sequence of solution of the individual problems is immaterial, in the case of a three-layer system a definite sequence must be adhered to. Concrete equations are given for systems of plates, systems of cylinders, and systems of spheres. Original article has: 17 formulas

TITLE: Sensitometric test for controlling color reproduction. I. Construc-  
tion principles of the test

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 87, abstract 3D589  
("Tr. Leningr. in-ta kinoinzhenerov", 1961, no. 6, 91 - 98)

TEXT: This is a report on elaborated construction principles of a test  
for investigating and controlling color reproduction in color photography proces-  
ses. The application of such a test permits to replace the physiological colo-  
rimetric evaluation of the color reproduction by a physical evaluation, based on  
the measurement of the dye concentrations. The investigation, by this test, of  
all the stages of a color photography process (color separation, synthetic and  
gradation stages) in their mutual relationship permits to describe the color re-  
production as an objective process property characterized by the configuration  
of the color reproduction bands. The test provides the possibility to judge on

the intermediate images, obtained at the different technological stages, about the color separation and gradation characteristics of these stages. Thus, with the aid of the test, it is possible to determine the part of different technological factors in the formation of the quality of a color image. It is shown that by the test it is possible to compare objectively different color photography processes and different technological variations of the same process.
